

The Union Mason Advantage - Safety

How much does an accident on your project cost you in terms of money and time? How does one OSHA accident investigation affect your project? Using union workers will help make your jobsite safer, more productive and efficient.

Union workers receive training that provides them with safer processes. The worker makes their (and the site's) work areas safer for themselves and those around them. They perform their work in accordance with safety guidelines and training.

Using the best people builds the best results. A job site is only as safe as its individuals. Union bricklayers receive documented training and have their skills sharpened at the District Council Training Center (DCTC) in Addison, Illinois. Classes include both hands on and classroom training. The following safety classes are offered to union members:

Fall Protection
Silica Awareness
OSHA 10 hour
OSHA 30 hour
Scaffold User Training
Safety Refresher Training
Lead Safety for Renovation, Repair and Painting
Crane Signal Person
www.bac2school.org

They also provide on-demand training on topics such as first aid or CPR. DCTC is open the entire year for the member's use. Classes are led by experienced trainers, certified by the International Masonry Institute Instructor's Certification Program, and are available during the entire year. What is more effective - watching a video on line or participating in actual hands on training where one can interact with the instructor?

On your project, would you want someone who has had documented safety training and will work on your site in a safe manner, or would you rather have someone who just "shows up" and starts working.

Working safely avoids accidents, thereby improving productivity and the project schedule.
Using the best people builds the best results.
